Contents

Introduction................................................................................................................................1

Recommendations....................................................................................................................3

How did 9/11 Help NYC Cope with the Next Disaster? .............................................................9
Engineering Preparedness Perspective of the World Trade Center Collapse
Gene Corley, Construction Technology Laboratories, Inc. ......................................................11

Achieving Resilience in the Face of Complex Civil Emergencies...........................................13
A Unified Technology Transfer Approach to Improve Structural Resiliency for Earthquake, Blast and Other Extreme Loading Conditions
Richard Little, National Research Council .............................................................................15

Security in the Post 9/11 Environment
Randy Nason, C.H. Guernsey & Company ..............................................................................17

The Trade-offs of Handling Risk and Resilience
David Hadden, ARUP Security Consulting .............................................................................19

How NYC Adopted Earthquake-Resistant Design Codes
Richard Tomasetti, Thornton Tomasetti Group ......................................................................21

The Tools to Achieve Resilience--State-of-the-Art .................................................................23
The Tools to Achieve Resilience -- State-of-the-Art: Overview of Issues
Robert Smilowitz, Weidlinger Associates ..............................................................................25

Strategies and Tools in Blast Engineering

Easiest and Most Difficult Implosions
James Redyke, Dykon Demolition Group ..............................................................................31

Anti-Terrorism / Force Protection
Harold Sprague, Black & Veatch Special Projects Corp. ......................................................33

Advanced Technologies to Achieve Seismic Resilience
Michael Constantinou, University at Buffalo, State University of New York .....................35

Fire-Related Issues
Paul Senseny, Factory Mutual Global Research ..................................................................37
The Tools to Achieve Resilience -- The Future ............................................................ 39
An Overview of the Tools Needed to Achieve Resilient Building Designs: The Future
John Crawford, Kazagozian and Case .............................................................................. 41
Performance Based Design for Fire
Brian Meacham, ARUP Risk Consulting........................................................................ 43
Performance Based Design in Earthquake Engineering and Applications
to Design for Terror Resistant Construction
Ronald Hamburger, Simpson, Gumpertz & Heger, Inc. ................................................. 45
Blast-Mitigation Program at the Department of Defense
Douglas Sunshine and Frank Tyboroski, Department of Defense ................................. 47
Structural Control for Mitigation of Natural and Human-Made Disasters
Andrei Reinhorn, University at Buffalo, State University of New York ......................... 49
Design of Mission-Critical Facilities
Robert Bachman, Consultant............................................................................................. 51
Retrofit for Blast Mitigation Effects
Reed Mosher, U.S. Army Engineer Research and Development Center ...................... 53
Resilient Design Using a Complex Adaptive Systems Approach
Gary Dargush, Mark Green, Ramesh Sant, and Xiangjie Zhao,
University at Buffalo, State University of New York .................................................. 55
Comparison of Building Responses Under Blast and Earthquake
Loadings--A Case Study
George Lee, Multidisciplinary Center for Earthquake Engineering
Research/University at Buffalo, State University of New York ....................................... 57

The Political, Economic and Engineering Fusion of Resilience-Enhancing Design
.......................................................................................................................................... 59
Overview: Conceptualizing and Measuring Resilience for Principal and
Organizational Systems
Kathleen Tierney, Disaster Research Center, University of Delaware............................. 61
Enhancing Resilience of Integrated Civil Infrastructure Systems
Rae Zimmerman, Institute for Civil Infrastructure Systems ............................................ 65
World Trade Center Disaster: Response and Recovery Issues from
the Private Sector Perspective
Brent H. Woodworth, IBM Crisis Response Team ............................................................ 67
## Contents (Cont’d)

Disruptions in Interdependent Infrastructures: A Network Flows Approach  
*William Wallace, Rensselaer Polytechnic Institute* ..........................................................69

MCEER Research to Integrate Multidisciplinary Aspects of Resilience  
*Michel Bruneau, Multidisciplinary Center for Earthquake Engineering Research/University at Buffalo, State University of New York* ...........................................71

Understanding and Overcoming Obstacles to Hazard Mitigation  
*Daniel Alesch, University of Wisconsin* .................................................................73

Implementation of an Innovative Design Solution for Blast-Effects Mitigation Through Aggressive Multi-Lateral Dissemination  
*David Houghton and Jesse E. Karns, Myers Houghton & Partners* .........................75

Strengthening Resilience through Remote Sensing Data Fusion: The World Trade Center Example  
*Charles Huyck, ImageCat, Inc.* ..................................................................................77

Issues Related to the Adoption of New Design Approaches to Produce More Disaster-Resilient Structures  
*James Malley, Degenkolb Engineers* ..........................................................................79

**Biographies of Presenters** .............................................................................................81

**Workshop Information** ..................................................................................................149

Agenda ..............................................................................................................................151

Participants .......................................................................................................................155

**Presentations and Additional Information (on CD-ROM)**
